ABSTRACT

PURPOSE: To eliminate necessity for an operator to store respective kinds of information related to set sale goods by counting the **vending** number of goods at the time of corresponding to the set sale goods and subtracting a **discount** value from a **vending** amount and executing a totaling processing when the **vending** number coincides with the prescribed number.

CONSTITUTION: Information of the set sale goods, the **discount** value and the gathering number is prepared beforehand. When the information to specify the goods and the information corresponds to the set sale goods, the reading frequency is counted. When the reading frequency coincides with the prescribed number prepared beforehand, the **discount** value prepared beforehand is subtracted from the **vending** amount, and the totaling processing is executed. Thus, the operator does not need to store the set sale goods, and further, the necessity to package the set sale goods beforehand is also eliminated.
